

Specialists  
in steam.

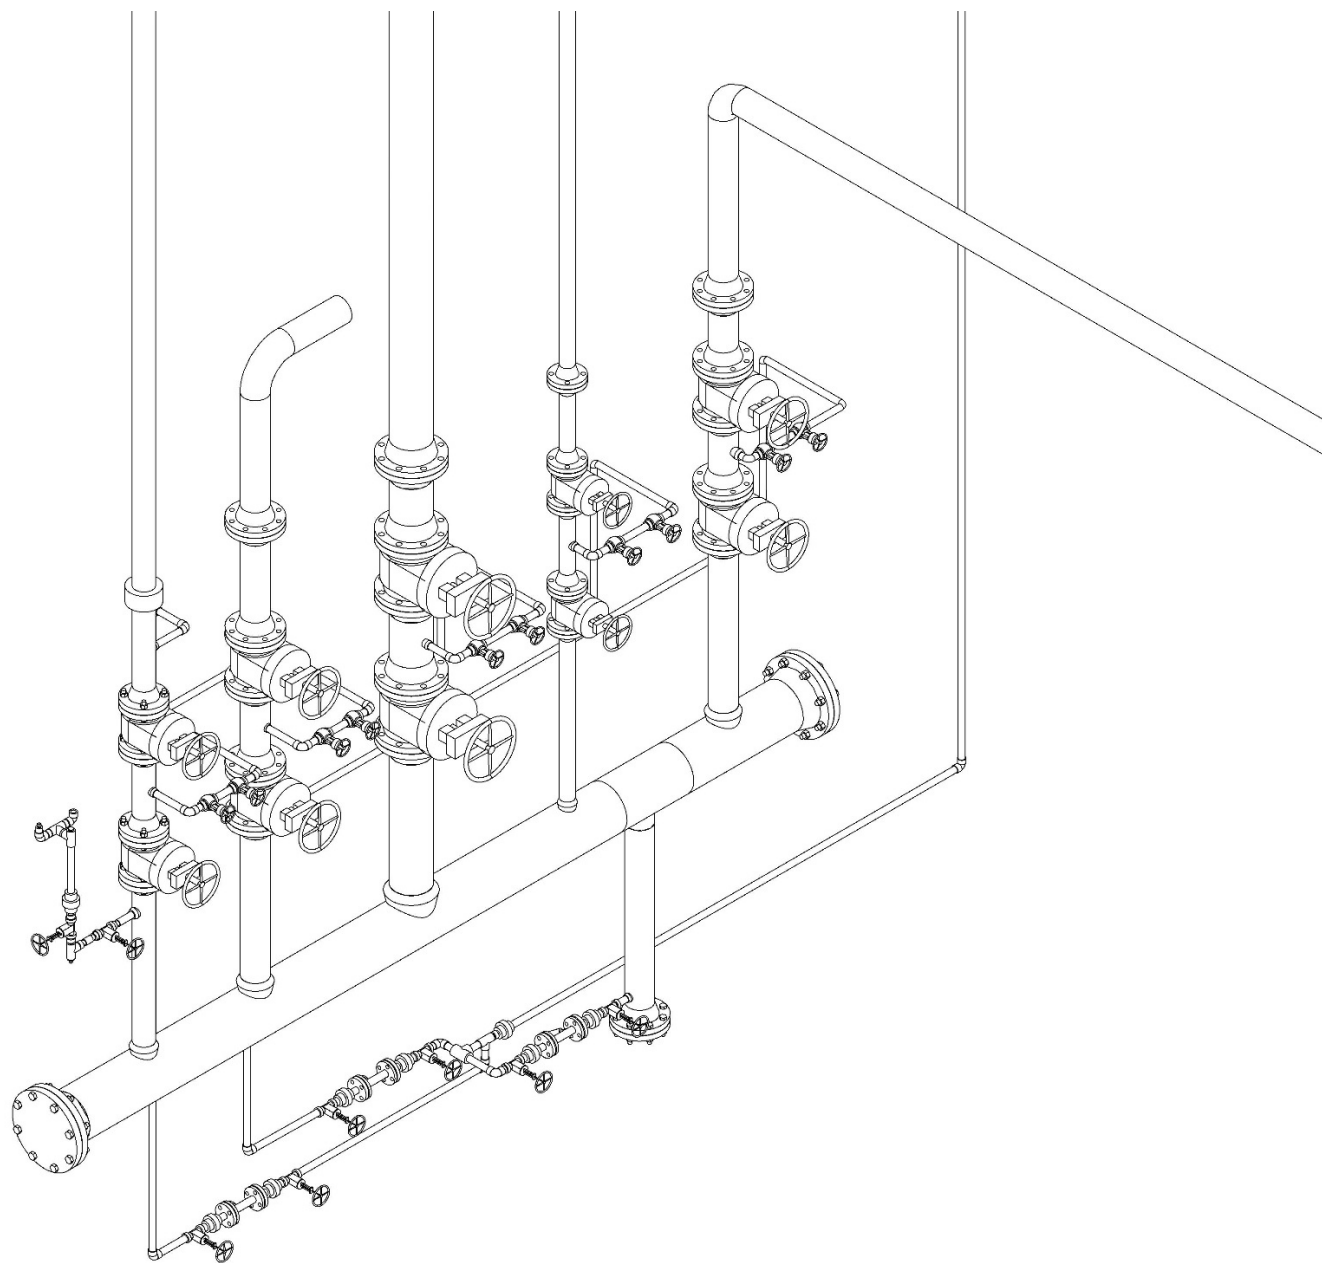

## STEAM DESIGN

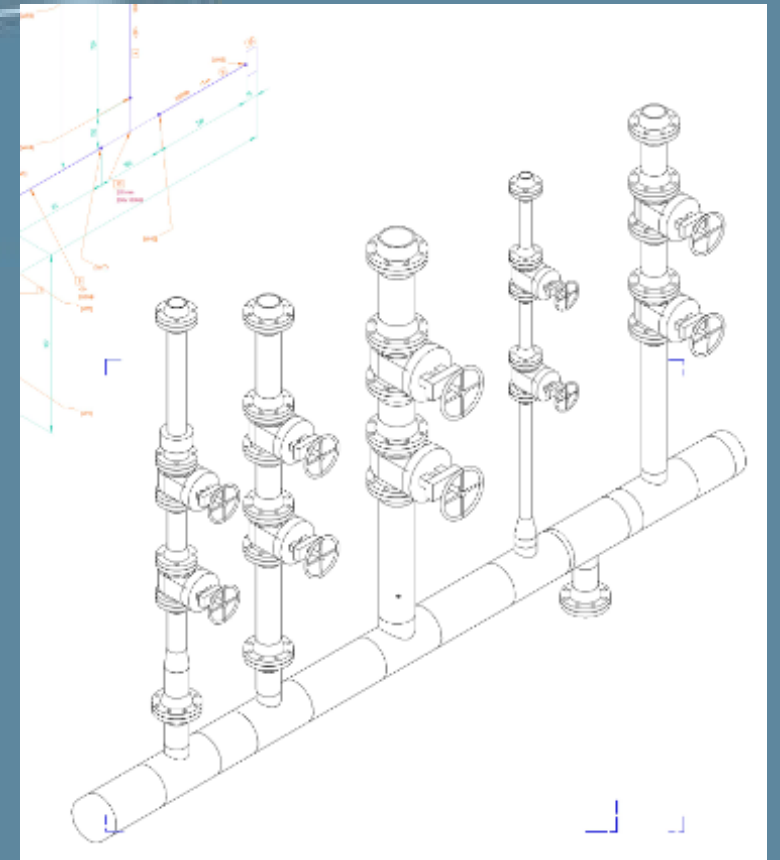

To determine the end users' requirements of a steam design we would first need to know the type of product and how much product is needed to be produced.

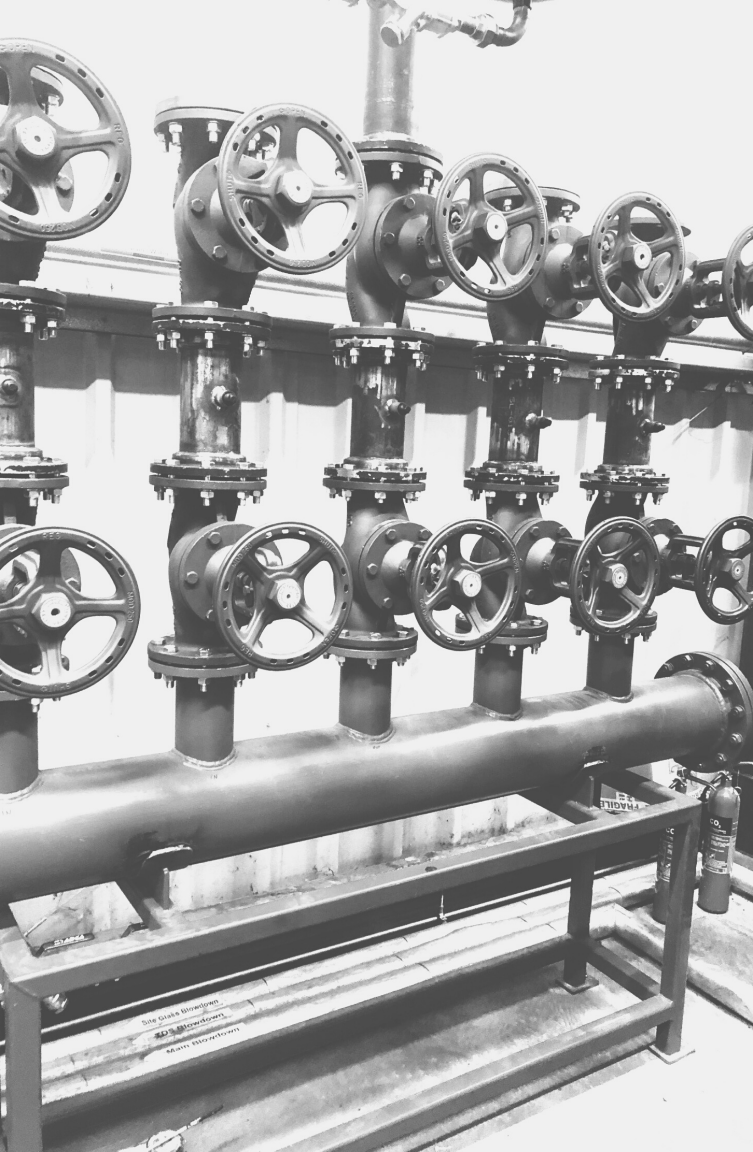

The amount of product is paramount so we are able to determine the correct size steam boiler, with the correct capacity to suit your requirements.

Other factors we consider are the boilers location with in your premises, be it vertical or horizontal, and the available fuels

## Optimise

Also at the beginnings of the steam design stage we would examine how best to install the pipework, allowing for expansion, pipe supports and pipe bridges.

Attention will also be given as to which parts of your site requires the steam and variation in pressures to each piece of equipment.

Please refer to our  
**STEP BY STEP**  
programme for more  
in depth information regarding  
our steam design .
